Problem Statement

The traditional hotel booking process can be time-consuming and inconvenient for many people. It often involves navigating through complicated websites or waiting in long phone queues to speak with customer service representatives. This can be especially frustrating for individuals who are on-the-go or have busy schedules. Additionally, for individuals with physical disabilities or limited access to technology, the hotel booking process can be even more challenging. A voice-based hotel booking app can provide a more accessible and efficient solution, allowing users to easily book hotels through a simple voice command system.

Proposed Solution

A voice-based hotel booking app uses speech recognition technology to make booking hotels convenient and accessible. Users can search and book hotels with simple voice commands, making it ideal for individuals with physical disabilities or busy schedules. Providing a streamlined and efficient booking experience for users.

The app is an innovative solution that enhances accessibility and improves the overall user experience for those looking to book hotels.

Features

Completely Voice Based

The proposed voice-based hotel booking app utilizes speech recognition to simplify and enhance the booking experience, providing real-time updates.

Real-Time Updates

Proposed solution will provide real-time updates on hotel availability and rates for more accurate booking.

Multilingual support.

We are not binding our users to English language only i.e. we are providing support for multiple languages.

Secure Payment Gateway

a secure payment gateway to handle payments, resulting in a better transaction experience and fewer payment failures.

Thank You
